What CSPs are asking us to solve — and how we answer as a portfolio

Problem → sellable offer → operated outcome · Productized core + configured edge · Growth with margin discipline

01 Multi-vendor complexity

Heterogeneous BSS/OSS estates make every integration and change slow, risky, and costly — with unclear accountability across vendors.

What they need

A governed multi-vendor integration layer, safe change paths, and single accountability for outcomes — not another point-to-point project.

02 New digital / B2B2X offers

New IoT and partner services need capabilities the current estate was never designed to deliver — without multi-year rebuilds.

What they need

Reusable capability packs and thin adapters to launch offers faster — custom only where it creates durable differentiation.

03 Faster differentiation

Off-the-shelf products rarely create advantage; CSPs need speed without locking into one-off builds that cannot scale.

What they need

Configurable offer ladder (land → expand → deepen) with clear time-to-market commitments and reuse across markets.

04 AI inside operations

Generic AI pilots do not fit CSP workflows; value appears only when intelligence is embedded in run, change, and commercial processes.

What they need

Domain AI & automation delivered as a managed service — with human override, auditability, and model lifecycle governance.

Customer outcome / value

Faster TTM · Lower integration & rework · 30–40% engineering effort where scoped · Run outcomes (availability, order/billing, incidents) · Reuse with maintainable cost-to-serve

Our answer

Solve inside the CSP BSS/OSS with a productized services portfolio: reusable core + configured edge + embedded AI, sold as clear offers (subscription / managed service), operated under shared KPIs — with Ericsson domain depth and day-2 accountability. Custom build only where it becomes reusable IP; not as the default.
